Fast - easy to operate - automatic - versatile Audiometry, Impedance and Reflex Test with **MI 26**

Fast diagnosis of the middle ear

The **MI 26** Impedance Screener with integrated audiometer performs fast impedance and ipsilateral reflex tests - a tympanogram takes only three seconds. Additionally, the model **MI 26 C** provides contralateral reflex measurements. The fast, virtually silent printer offers a printout of the test result within only 4 seconds.

The new, adjustable probe of the **MI 26** offers a wide flexibility for the handling. The probe tip can either be adjusted to straight, pen type (0° angle) operation or to 60° and 85° angle. An integrated switch allows to change the test ear directly at the probe. The integrated light changes to red (right ear) or blue (left ear) respectively.

Easy, comfortable to operate

The probe seal in the ear is easily checked with the built-in indicator light. The test starts immediately when a good seal is achieved. The tympanogram and test results are displayed in real time on the graphical LCD screen. The test results for both ears are stored and can be printed out together.

Automatic functions

The impedance test starts automatically. The intensity of the four frequencies of the following reflex test is increased automatically until a reflex is detected or the maximum is reached. The maximum level is adjustable to protect sensitive ears. An automatic printout of the test results can be selected.

Versatile, use with integrated Audiometer

The versatile **MI 26** offers in addition an integrated air conduction audiometer with 8 test frequencies. The audiograms for both ears are stored and can be printed out together.
